What is CSPM and CNAPP?

CSPM- Cloud Posture Management Tool:

- Finds, monitors, and fixes security issues in your cloud setup like AWS
- The main goal is compliance, visibility, and security posture
- Examples of some are Prowler, Prisma Cloud, and AWS Security Hub

CNAPP- Cloud Native Application Protection Platform:

- Protects your whole cloud application lifecycle — from code to runtime — using multiple security tools together, like AWS Config or CloudFormation Guard
- The main goal is end-to-end security from development to production
- Examples of some are Qualys Totalcloud, Wiz, Palo Alto Prisma Cloud

CSPM and CNAPP Comparison Table

Category	CSPM (Cloud Security Posture Management)	CNAPP (Cloud-Native Application Protection Platform)
Purpose	Finds and fixes cloud setup issues like wrong permissions or open storage (example: Prowler)	Secures the whole cloud app, from code to running systems, using multiple tools (example: TotalCloud)
Scope	Focuses on cloud infrastructure like S3, IAM, and VPC	Covers cloud infrastructure, workloads, CI/CD pipelines, and runtime environments
Deployment	Agentless — connects through cloud provider APIs	Mix of agentless scanning and agents inside workloads
Capabilities	Runs config checks, audits, and sends alerts for misconfigurations	Combines CSPM, workload protection (CWPP), identity management (CIEM), and code scanning (IaC)
Frameworks	Follows security standards like CIS, NIST, and ISO	Covers full development lifecycle (SDLC) and runtime security with DevSecOps integration

What is Compliance Framework?

A compliance framework is a structure of guidelines and best practices that organizations use to ensure the company meets security, privacy, and operational standards (e.g., NIST, ISO, SOC2).

Helps organizations prove they are handling data and risks properly.

About NIST 800-171

- NIST 800-171 is a cybersecurity framework developed by the National Institute of Standards and Technology (NIST)
- Its **focus** is on protecting Controlled Unclassified Information (CUI) in non-federal systems and organizations
- Its primary goal is to ensure sensitive government data remains secure when handled by contractors, universities, or private companies working with federal agencies.
- It provides a structured set of security requirements tailored for environments outside the federal government.

Key features:

- 14 Control Families
- 110 Individual Controls
- Focus on access control, incident response, system integrity, and more.

NIST 800-171 Control Families

1. Access Control (AC)
2. Awareness and Training (AT)
3. Audit and Accountability (AU)
4. Configuration Management (CM)
5. Identification and Authentication (IA)
6. Incident Response (IR)
7. Maintenance (MA)
8. Media Protection (MP)
9. Personnel Security (PS)
10. Physical Protection (PE)
11. Risk Assessment (RA)

CIS Amazon Web Service Foundation Benchmark

Control Families:

1. Identify and Access Management
2. Storage
3. Logging
4. Monitoring
5. Networking

Overview:

All CIS Benchmarks™ (Benchmarks) focus on technical configuration settings used to maintain and/or increase the security of the addressed technology, and they should be used in conjunction with other essential cyber hygiene tasks.

Risk is the possibility that something bad could happen that might hurt a company, a system, or people. In cybersecurity, risk happens when there is a weakness (called a vulnerability) in a system that could be attacked by a threat.

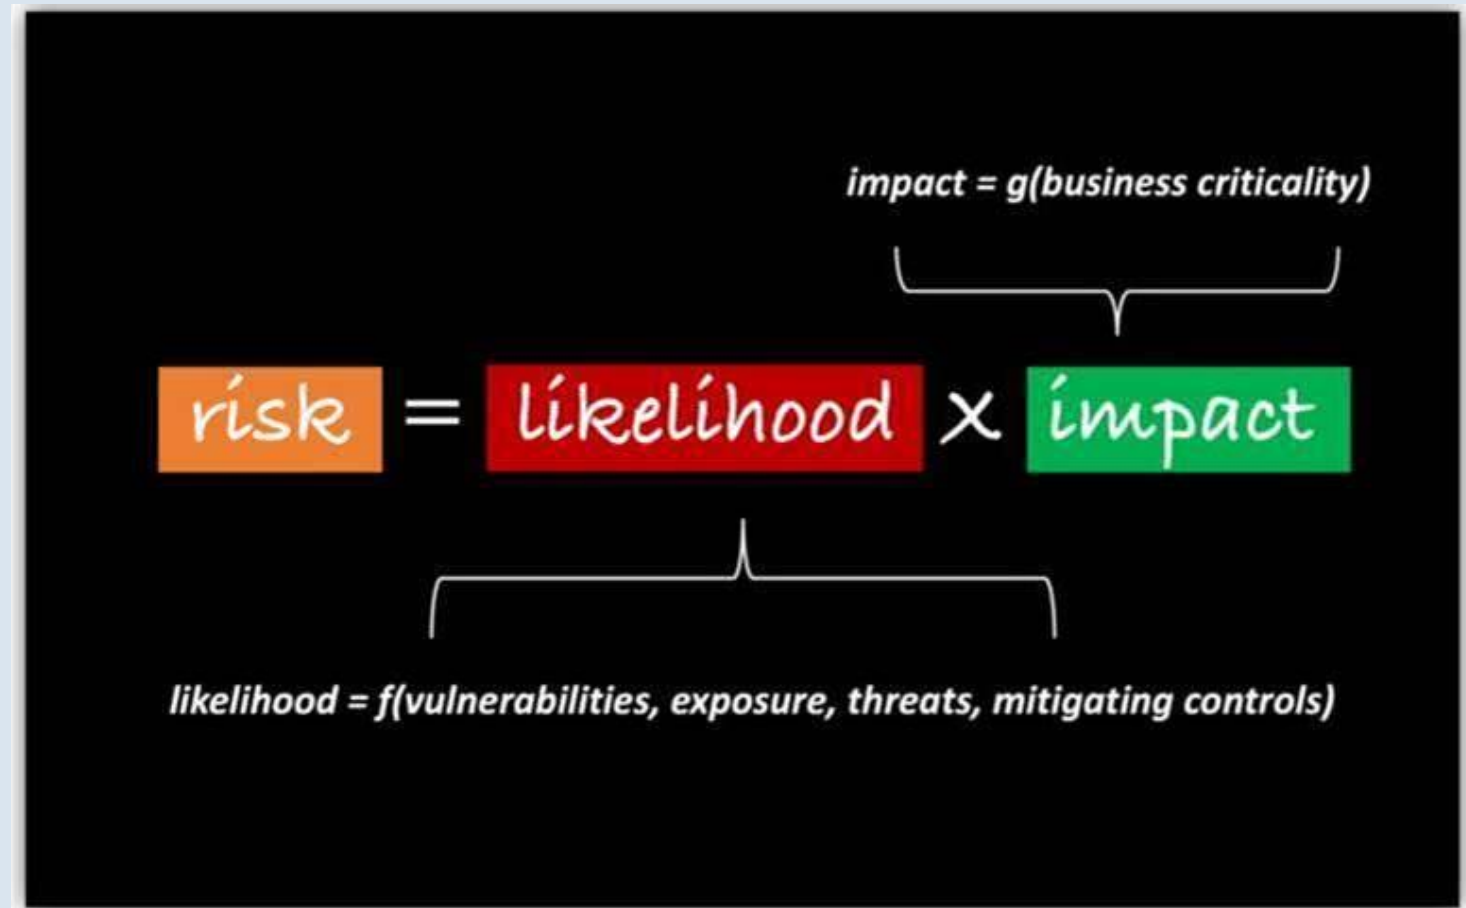

What is Risk?

How is it Calculated?

Risk = Likelihood × Impact

- **Likelihood:** How likely is it that something bad will happen?
- **Impact:** How bad would it be if it did happen? (e.g., data breach, service outage).

Risk Matrix

Possible	Major	Major	Major
Likely	Moderate	Major	Major
Rare	Minor	Moderate	Major
	Low	Medium	High

3x3 Qualys Totalcloud Finding Matrix

4x4 NIST 800-171 Finding Matrix

Probable	Critical	Critical	Critical	Critical
Possible	Major	Critical	Critical	Critical
Unlikely	Moderate	Major	Critical	Critical
Rare	Minor	Moderate	Major	Critical
	Low	Medium	High	Very High

What is Risk Mitigation?

Reducing the likelihood of a risk occurring or lessening its impact if it does occur is known as risk mitigation.

AVOIDANCE

- Eliminate the risk completely
- Ex. Not storing sensitive data in cloud

REDUCTION

- Lessen the likelihood/impact
- Ex. Enabling MFA to reduce breach risk

TRANSFERENCE

- Shift risk to third-party
- Ex. Buying cyber insurance

ACCEPTANCE

- Acknowledge and monitor the risk
- Ex. Accept minor risks of low impact

Prowler Finding 1:

Probable	Critical	Critical	Critical	Critical
Possible	Major	Critical	Critical	Critical
Unlikely	Moderate	Major	Critical	Critical
Rare	Minor	Moderate	Major	Critical
	Low	Medium	High	Very High

<i>Finding Name and Title</i>	iam_user_mfa_enabled_console_access Ensure multi-factor authentication (MFA) is enabled for all IAM users that have a console password
<i>Service</i>	IAM
<i>Risk, Severity, and Risk Mitigation Type</i>	Unauthorized users could access AWS accounts if only a password is required (no MFA) Risk Equation: Likelihood × Impact Likelihood: Possible – password based accounts are a frequent target for attacks Impact: High – account compromise could lead to full environment control
<i>Recommended Mitigation</i>	Type of Mitigation: The recommended risk mitigation type is Avoidance Why Risk Avoidance? Requiring MFA reduces the chance of unauthorized access close to zero, directly addressing both the likelihood and impact. Enforce MFA for all IAM users through IAM policies and AWS Configuration rules
<i>NIST 800-171 Family and Control</i>	Access Control (AC) → 3.1.1, 3.1.2, 3.1.3, 3.1.14, 3.1.20 Identification and Authentication → 3.5.2, 3.5.3
<i>Cross Framework Mapping</i>	NIST 800-53 - Mapped? Yes ISO 27001:2013 - Mapped? Yes SOC2 - Mapped? Yes

FAIL	high	iam	us-east-1	iam_user_mfa_enabled_console_access	Ensure multi-factor authentication (MFA) is enabled for all IAM users that have a console password.
------	------	-----	-----------	-------------------------------------	---

Prowler Finding 1

User admin-tram has Console Password enabled but MFA disabled.

Unauthorized access to this critical account if password is not secure or it is disclosed in any way.

Enable MFA for the user's account. MFA is a simple best practice that adds an extra layer of protection on top of your user name and password. Recommended to use hardware keys over virtual MFA.

<i>Finding Name and Title</i>	CID-32 - Ensure AWS Management Console authentication failures are monitored
<i>Resource and Service</i>	CloudTrail / CloudWatch
<i>Risk, Severity, and Risk Mitigation Type</i>	<p>The AWS environment is not currently monitoring authentication failures on the AWS Management Console. This lack of visibility means failed login attempts by unauthorized users may go undetected, increasing the likelihood of successful brute-force or credential stuffing attacks.</p> <p>Risk Equation: Likelihood x Impact</p> <p>Likelihood: Likely - Unauthorized access attempts via the AWS Management Console are a common vector for intrusion and often go unnoticed if not monitored.</p> <p>Impact: Medium (potential data breach, delayed response, non-compliance)</p>
<i>Recommended Mitigation</i>	<p>Type of Mitigation? The recommended mitigation is remediation.</p> <p>Why? This is a configuration issue that can be remediated by enabling log monitoring for authentication failures. Specifically, ensure that AWS CloudTrail is logging management events and that CloudWatch Alarms or SIEM tools are configured to alert on failed login attempts.</p>
<i>CIS AWS Foundation Benchmark</i>	<ul style="list-style-type: none">● Control 4.6 – Ensure AWS Management Console authentication failures are monitored● Profile Applicability: Level 2● Rationale: Monitoring failed console logins can detect brute-force attacks and provide actionable indicators like source IPs. <p>Audit: Ensure an active multi-region CloudTrail trail is configured, and CloudWatch metric filters and alarms exist for <u>ConsoleLogin</u> failures.</p>

Evidence

Run Time Remediation Steps

Follow these steps to remediate

Perform the following to setup the metric filter, alarm, SNS topic, and subscription:

Method1: Via CLI

1. Create a metric filter based on filter pattern provided which checks for unauthorized API calls and the <cloudtrail_log_group_name>

aws logs put-metric-filter --log-group-name <cloudtrail_log_group_name> --filter-name <Name_for_metric> --metric-transformations metricName=<Name_for_metric>,metricNamespace='CISBenchmark',metricValue=1 --filter-pattern '{ (\$eventName = ConsoleLogin) && (\$errorMessage = "Failed authentication") }'

Note: You can choose your own metricName and metricNamespace strings. Using the same metricNamespace for all Foundations Benchmark metrics will group them together.

2. Create an SNS topic that the alarm will notify

aws sns create-topic --name <sns_topic_name>

Note: you can execute this command once and then re-use the same topic for all monitoring alarms.

3. Create an SNS subscription to the topic created in step 2

aws sns subscribe --topic-arn <sns_topic_arn> --protocol <protocol_for_sns> --notification-endpoint <sns_subscription_endpoints>

Note: you can execute this command once and then re-use the SNS subscription for all monitoring alarms.

4. Create an alarm that is associated with the CloudWatch Logs Metric Filter created in step 1 and an SNS topic created in step 2

aws cloudwatch put-metric-alarm --alarm-name <Name_for_alarm> --metric-name <Name_for_metric> --statistic Sum --period 300 --threshold 1 --comparison-operator GreaterThanOrEqualToThreshold --evaluation-periods 1 --namespace 'CISBenchmark' --alarm-actions <sns_topic_arn>

Note: set the period and threshold to values that fit your organization.

OK

Run Time Remediation Steps

Follow these steps to remediate

To enable server access logging for an S3 bucket:

1. Sign in to the AWS Management Console and open the Amazon S3 console at <https://console.aws.amazon.com/s3/>.

2. In the **Bucket name** list, choose the name of the bucket that you want to enable server access logging for.

3. Choose **Properties**.

4. In **Server access logging** section, click Edit on the right.

5. Choose **Enable** under Server Access Logging. For **Target bucket**, enter the name of the bucket that you want to receive the log record objects.

The target bucket must be in the same Region as the source bucket and must not have a default retention period configuration.

6. (Optional) For **Target prefix**, type a key name prefix for log objects, so that all the log objects begin with the same string.

7. Choose **Save Changes**.

Reference:

<https://docs.aws.amazon.com/AmazonS3/latest/user-guide/server-access-logging.html>

Using AWS CLI:

To find out the name of the S3 bucket that is receiving CloudTrail logs, execute the following command:

aws cloudtrail describe-trails --region --query trailList[*].S3BucketName

In the template below, replace [Logging_BucketName] with the name of your target bucket, [LogFilePrefix] with the prefix for your log file, and, if desired, include an email address. Save the modified template as [FileName.Json]:

OK

<i>Finding Name and Title</i>	iam_aws_attached_policy_no_administration_privileges Ensure IAM AWS-Managed policies that allow full "." administrative privileges are attached
<i>Service</i>	IAM
<i>Risk, Severity, and Risk Mitigation Type</i>	<p>The root account is the most privileged user in an AWS account. MFA adds an extra layer of protection on top of a user name and password. With MFA enabled when a user signs in to an AWS website they will be prompted for their user name and password as well as for an authentication code from their AWS MFA device. For Level 2 it is recommended that the root account be protected with only a hardware MFA</p> <p>Risk Equation: Likelihood × Impact</p> <p>Likelihood: Probable – Due to the privilege it is most probable to be compromised</p> <p>Impact: Critical – The root account is the most important account to protect</p>
<i>Recommended Mitigation</i>	<p>Type of Mitigation: The recommended risk mitigation type is Reduction</p> <p>Why Risk Reduction? The recommended solution is using IAM console navigate to Dashboard and expand Activate MFA on your root account</p>
<i>NIST 800-171 Family and Control</i>	<p>Access Control (AC) → 3.1.1, 3.1.2</p> <p>Configuration Management → 3.4.6</p> <p>System and Communication Protection → 3.13.3</p>
<i>Cross Framework Mapping</i>	<p>NIST 800-53 - Mapped? Yes</p> <p>ISO 27001:2013 - Mapped? Yes</p> <p>SOC2 - Mapped? No</p>

FAIL	high	iam	us-east-1	iam_aws _attached _policy_no _administrative _privileges	Ensure IAM AWS- Managed policies that allow full "*" administrative privileges are not attached				
						AWS policy AdministratorAccess is attached and allows "*" administrative privileges.	IAM policies are the means by which privileges are granted to users, groups, or roles. It is recommended an considered a standard security advice to grant least privilege—that is, granting only the permissions required to perform a task. Determine what users need to do and then craft policies for them that let the users perform only those tasks instead of allowing full administrative privileges. Providing full administrative privileges instead of restricting to the minimum set of	It is more secure to start with a minimum set of permissions and grant additional permissions as necessary, rather than starting with permissions that are too lenient and then trying to tighten them later. List policies and analyze if permissions are the least possible to conduct business activities.	<ul style="list-style-type: none"> •CISA: your-systems-3, your-surroundings-3 •RBI-Cyber-Security-Framework: annex_i_7_1 •CIS-3.0: 1.16 •HIPAA: 164_308_a_1_ii_b, 164_308_a_3_i, 164_308_a_3_ii_b, 164_308_a_4_i, 164_308_a_4_ii_b, 164_308_a_4_ii_c, 164_312_a_1 •FedRamp-Moderate-Revision-4: ac-2-1, ac-2-f, ac-2-j, ac-3, ac-5-c, ac-6-10, ac-6, sc-2 •AWS-Well-Architected-Framework-Security-Pillar: SEC03-BP02 •CIS-1.5: 1.16 •SOC2: cc_1_3, cc_6_3 •GDPR: article_25 •KISA-ISMS-P-2023: 2.5.1 •NIST-800-171-Revision-2: 3_1_1, 3_1_2, 3_1_4, 3_1_5, 3_1_6, 3_1_7, 3_4_6, 3_13_3 •ISO27001-

Prowler Finding 4

TotalCloud Findings 4:

Possible	Major	Major	Major
Likely	Moderate	Major	Major
Rare	Minor	Moderate	Major
	Low	Medium	High

<i>Finding Name and Title</i>	CID-27 - Ensure unauthorized API calls are monitored
<i>Service</i>	CloudTrail
<i>Risk, Severity, and Risk Mitigation Type</i>	<p>Real-time monitoring of API calls can be achieved by directing CloudTrail Logs to CloudWatch Logs or an external Security Information and Event Management (SIEM) environment, and establishing corresponding metric filters and alarms.</p> <p>Risk Equation: Likelihood x Impact</p> <p>Likelihood: Possible - This can happen often without the proper monitoring</p> <p>Impact: High - This alert may be triggered by normal read-only console activities that attempt to opportunistically gather optional information but gracefully fail if they lack the necessary permissions.</p>
<i>Recommended Mitigation</i>	<p>Type of Mitigation? The recommended mitigation is Reduction.</p> <p>Why? Risk Reduction - To monitor unauthorized API calls in AWS, you can set up a CloudWatch alarm using the AWS Command Line Interface (CLI). This process involves creating a metric filter to detect specific error codes in CloudTrail logs, establishing an Amazon Simple Notification Service (SNS) topic for notifications, subscribing endpoints to this topic, and configuring a CloudWatch alarm to trigger notifications upon detecting unauthorized activities. It is recommended that a metric filter and alarm be established for unauthorized API calls.</p>
<i>CIS AWS Foundation Benchmark</i>	<p>Control Family: 4 - Monitoring</p> <ul style="list-style-type: none"> 4.1 Ensure unauthorized API calls are monitored (Manual) Profile Applicability: Level 2 Rationale: CloudWatch is an AWS native service that allows you to observe and monitor resources and applications. CloudTrail logs can also be sent to an external Security Information and Event Management (SIEM) environment for monitoring and alerting

Run Time Remediation Steps

Follow these steps to remediate

Perform the following to setup the metric filter, alarm, SNS topic, and subscription:

Method1: Via CLI

- Create a metric filter based on filter pattern provided which checks for unauthorized API calls and the <cloudtrail_log_group_name>
 - # aws logs put-metric-filter --log-group-name <cloudtrail_log_group_name> --filter-name <Name_for_metric> --metric-transformations metricName=<Name_for_metric>,metricNamespace='CISBenchmark',metricValue=1 --filter-pattern '{ (\$.errorCode = "UnauthorizedOperation") || (\$.errorCode = "AccessDenied") }'
 - Note: You can choose your own metricName and metricNamespace strings. Using the same metricNamespace for all Foundations Benchmark metrics will group them together.
- Create an SNS topic that the alarm will notify
 - # aws sns create-topic --name <sns_topic_name>
 - Note: you can execute this command once and then re-use the same topic for all monitoring alarms.
- Create an SNS subscription to the topic created in step 2
 - # aws sns subscribe --topic-arn <sns_topic_arn> --protocol <protocol_for_sns> --notification-endpoint <sns_subscription_endpoints>
 - Note: you can execute this command once and then re-use the SNS subscription for all monitoring alarms.
- Create an alarm that is associated with the CloudWatch Logs Metric Filter created in step 1 and an SNS topic created in step 2
 - # aws cloudwatch put-metric-alarm --alarm-name <Name_for_alarm> --metric-name <Name_for_metric> --statistic Sum --period 300 --threshold 1 --comparison-operator GreaterThanOrEqualToThreshold --evaluation-periods 1 --namespace 'CISBenchmark' --alarm-actions <sns_topic_arn>
 - Note: set the period and threshold to values that fit your organization.

Mitigation Plan/ Schedule

- Organize findings by severity (Critical → High → Medium → Low).
- Build a simple plan: Critical findings = immediate remediation (0-2 weeks), High = 2-4 weeks, Medium = 1-2 months, Low = 2-3 months.

Challenges Faced

1. Prowler has the exact mappings in the compliance column, but with Qualys TotalCloud, we had to search for each control family and the specific mapping.
2. Prowler takes more time to set up; you have to install it in CloudShell each time.
3. With TotalCloud, we switched from AWS Best Practices to CIS Amazon Web Service Foundation Benchmark policy to find all our failed findings.

Thank you

Any Further Questions?
